SYSTEM READINESS

Prove the backend works

Walk through the customer journey

Walk through customers, account creation, logins, tracking, and the connection between the backend and the customer-facing website. Show how changes reach the front end.

Know where everything lives

Explain where everything is saved, including customer records, account information, orders, tracking, site content, and agent information.

Review the latest updates

Review our latest backend updates, what is already working, and what remains unfinished or disconnected.

SYSTEM READINESS

Understand the connections

Map the system

Show me the complete system and data flow: what runs on the front end, what runs on the backend, what Supabase stores or controls, what GitHub contains, and how a change moves from the code to the live site.

Show me where to make changes

Show me where I should make future changes, how GitHub and Supabase should be updated together, and which changes can affect customer data, logins, orders, tracking, website content, or the AI brain.

Give me a usable handoff

Leave me with a simple written map of the system, the accounts and access I need, the changes I can safely make myself, and the changes Riley should review before they go live.

SYSTEM READINESS

Add features with confidence

A repeatable update process

Give me a safe process for adding features: create a separate GitHub branch, preview and test the change, review any Supabase database or permission changes, approve the update, deploy it, and verify the live result.

Checks and balances

Set up checks and balances so I do not accidentally break the live site or data. Cover backups, database migrations, access permissions, automated checks, a staging or preview environment, deployment approval, monitoring, and rollback.

SYSTEM READINESS

Make the agents useful

Customer agent

Connect the customer agent to the TrueMark brain so it can learn and improve over time, use its capabilities to help customers thoughtfully, and avoid repeating the same canned answers. Agree on how learning and memory will work.

Partner agent

Make the partner agent useful and capable of taking action, beyond answering from fixed chatbot data. Review the partner capabilities we already discussed and confirm they are connected.

My personal agent

My personal agent already has a running version. Review its existing setup and connections. Demonstrate a complete task for the customer and partner agents and confirm their data access and permissions.

SYSTEM READINESS

Finish the connections

Analytics

Connect Google Analytics and confirm that tracking works.

Email flows and the email agent

Review email flows and the email-flow agent we discussed. Identify the software, triggers, and backend connections needed.

Website URL and payment processing

Confirm the website URL we need so we can move forward with a payment processor. Identify anything still needed before we can apply or connect it.

OPERATIONS

Shipping status should reflect reality

01 Packed

Print a label and mark the order “Packed.”

02 Dropping off

Use “Dropping off” for the stage before the carrier confirms shipment, instead of marking it “Shipped” too early.

03 Shipped

Automatically mark the order “Shipped” once UPS or FedEx scans the package and tracking confirms the handoff.

Mobile shipping desk

Fix the mobile shipping desk view where content is cut off below the fulfillment queue.

OPERATIONS

Refine the Command Center

Order states

Orders and overview: remove the “Placed” state because the intended flow treats placed orders as paid. Confirm the payment behavior before changing the status logic.

Risk review

Risk review: set up automatic review triggers for large orders. Agree on the quantity thresholds.

Lots and inventory

Lots and certificates: refine lot management and certificate tracking views. Products and inventory: improve inventory synchronization and management.

Customer messages

Combine inboxes and allow messages to customer accounts directly from the dashboard.

OPERATIONS

Improve the business tools

Research Blog

Rename “Journal” to “Research Blog.” Make it possible to publish new posts so they appear automatically and manually edit existing copy.

Profit planner

Add testing costs, affiliate costs, and discount percentage. Agree on how each affects the profit calculation.

STOREFRONT

Polish the homepage

Brand and hero copy

“TRUEMARK” replaced “Verified.” Move it slightly behind the vials, as in the original design. Keep “RESEARCH PEPTIDES” beneath “True precision” and replace remaining “Research Compounds” wording.

Shop Peptides button

“Shop Peptides” replaced “View catalog.” Make the button reappear below the “Organized by compound class” section.

Promotions

Clean up the placement of the free-shipping offer and “10% off your first order.” Use the updated $200 free-shipping threshold consistently; the reference screenshot still shows $150.

ORIGINAL ISSUE REFERENCE

STOREFRONT

Make the collection easy to explore

Look Closer

Look Closer: skip step 01 and go straight to step 02 so the feature shows its function instead of only zooming in on the vial.

Clickable classes and a continuous carousel

Compound classes: make the peptides clickable so they lead to the relevant categories. Add continuous carousel scrolling in class order and automatic sliding.

Reliable desktop animation

Fix the desktop compound-class animation. It moves up and down and currently needs an exact scroll position to display and work properly.

An intuitive mobile experience

Add animation on mobile when scrolling down from the homepage. Review the spotlight collection carousel: I like it on desktop, but it is not intuitive on mobile.

STOREFRONT

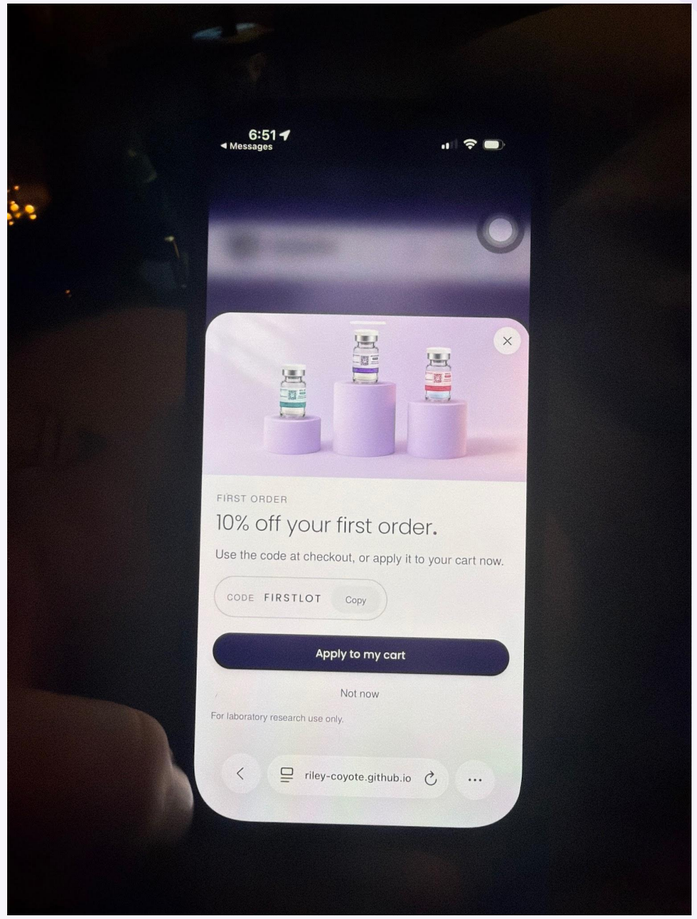

Let visitors scroll before the offer

First-order popup

Show this popup only after the visitor has scrolled down a little. Agree on the point at which it should appear.

Timing to confirm

Agree on how far visitors should scroll before the offer appears.

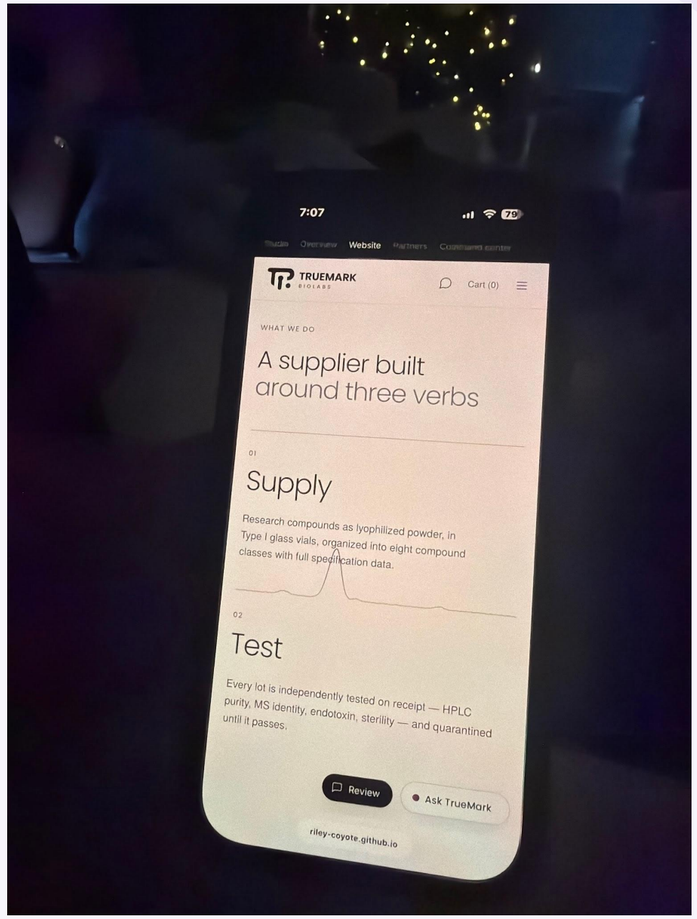

ORIGINAL ISSUE REFERENCE

STOREFRONT

Fix the mobile About page

Keep the animation clear of the copy

Resolve the layout and function bugs on the About page. The purity animation overlaps the text on mobile.

ORIGINAL ISSUE REFERENCE

SHOPPING EXPERIENCE

Make account creation clearer

Research account flow

Discuss the research account application flow in depth and rethink how the overall process should work.

First visit and verification

Review the first-visit research guidelines and verification flow, including how the guidelines open and how the CAPTCHA works.

Application wording

Change the account application action from “Apply” to “Create.”

SHOPPING EXPERIENCE

Clarify products and verification

Vial options and discounts

Show 1-vial, discounted 2-vial, and discounted 3-vial options. Confirm the discount amounts.

Show every purity result

For stacks, show all relevant purity results on the product page and the Verify page. Remove the limitation that prevents all purity percentages from reaching the main site.

GLP-1 names

Change the GLP-1 names. Confirm the exact replacement names before making the edits.

Verify animation

Revisit the Verify page animation. I preferred the original animation, but want it to fit the current visual style.

SHOPPING EXPERIENCE

Make the cart feel polished

Consistent mobile and desktop behavior

Use the same add-to-cart popup on desktop as on mobile. Clean up the cart and add-to-cart animations on mobile and desktop so the movement, timing, and confirmation feel polished and consistent.

Cart box and progress bar animations

Revamp the cart box, popup motion, and progress bar animations on mobile and desktop. Mimic the homepage slider, with smooth progress toward free Bac Water at $75 and free shipping at $200. Use the end-to-end lot explanation as the progress-bar styling reference.

Shipping insurance

Add shipping insurance to the cart, enabled by default with an option for the customer to turn it off.

Make the rewards easy to understand

Free Bac Water at $75

Unlock free Bac Water at $75 and show progress toward this reward in the cart.

Free shipping at $200

Use $200 throughout the cart, homepage promotions, and checkout. Update older $150 free-shipping wording.

Loyalty points

Integrate the loyalty points system and agree on the earning and redemption rules.

Confirm the remaining details

Agree on the account and first-visit flow, GLP-1 replacement names, vial discounts, and the Verify animation reference. Reward thresholds are $75 for free Bac Water and $200 for free shipping.

VISUAL BUGS

Smooth out the background

Refresh and scroll flicker

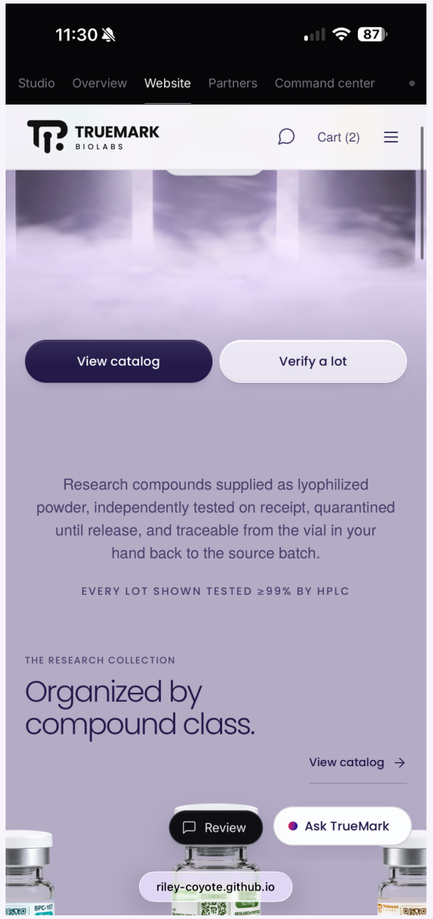

Fix the background changing or jumping from dark to light on initial refresh and while scrolling.

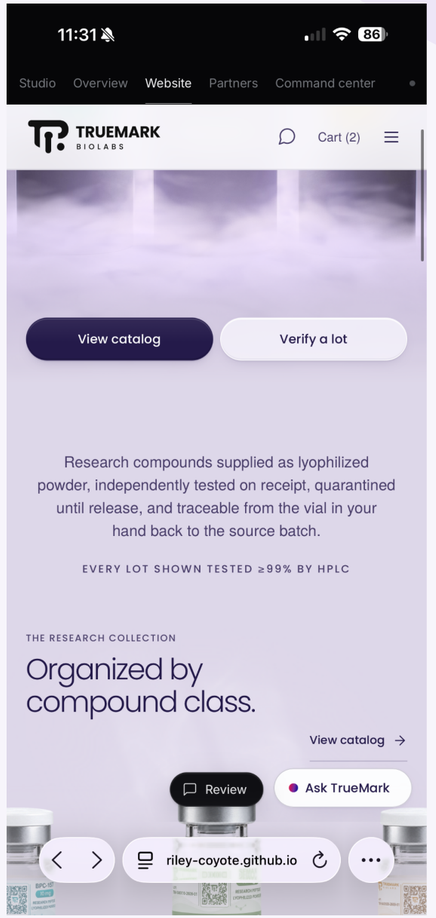

Continuous light movement

Make the background hue and light effect move smoothly during scrolling, as it does on desktop. It currently jumps after scrolling stops.

Compound-class transition

Check the transition into the compound-class section alongside the desktop animation fix in the homepage section.

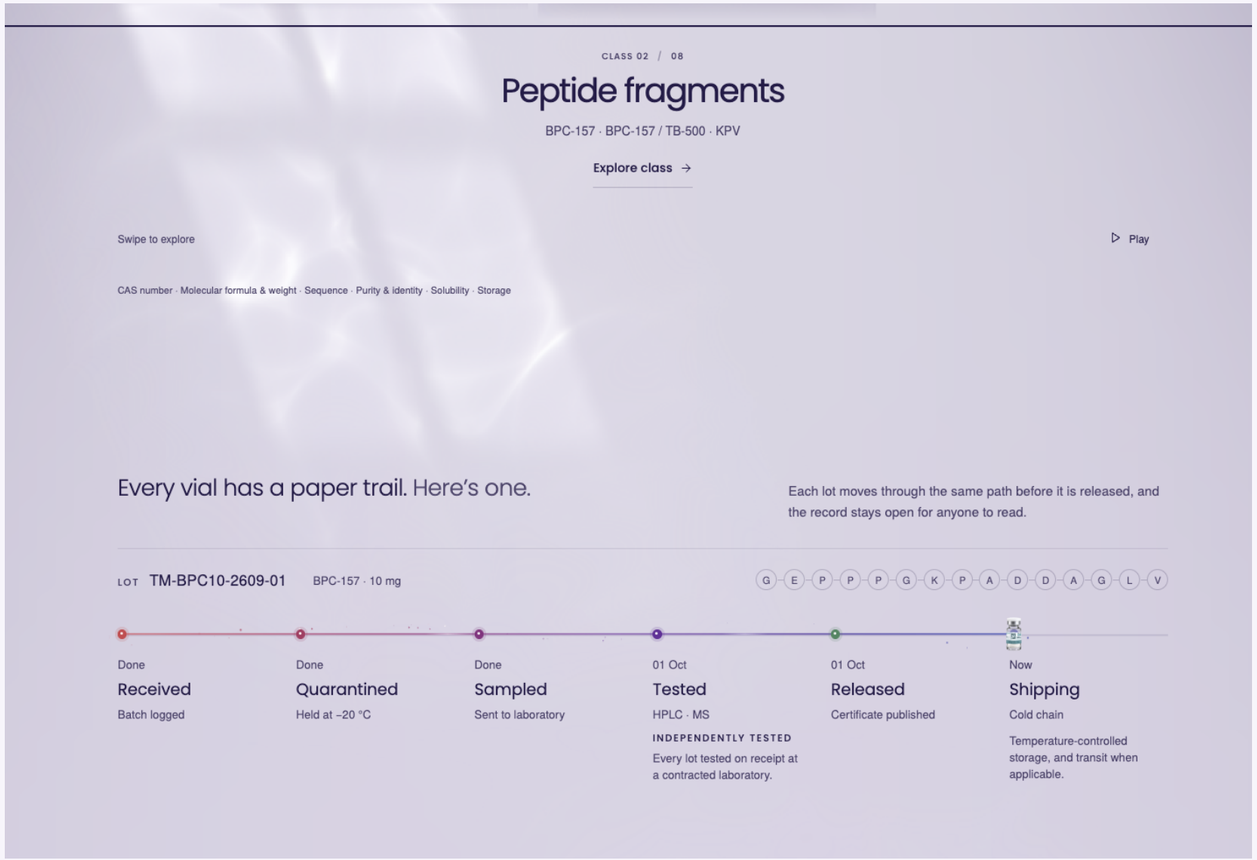

ORIGINAL ISSUE REFERENCE

VISUAL BUGS

Remove unexpected empty space

Spacing across pages

Fix empty-space glitches across pages, including the Coenzymes & cofactors section.

ORIGINAL ISSUE REFERENCE

VISUAL BUGS

Check navigation and Windows behavior

Returning to the homepage

The homepage loads correctly on the first visit. After opening another page, returning home through the navigation logo or the browser Back button produces a glitchy load. Reproduce and fix both return paths.

HP Envy on Windows

On my mom’s HP Envy, the site shows the desktop layout and navigation, but behaves as though it loaded the mobile version: no animation on scroll, a carousel that is not continuous, and a glitchy background. Investigate why these mobile-style issues appear in the desktop view. Confirm the browser, affected pages, and steps to reproduce.

DISCUSSION

Questions to settle with Riley

Working today

Which parts of the backend and integrations can we demonstrate working now, and which still need to be built or connected?

Agent behavior

How will the customer agent learn through the TrueMark brain and give more thoughtful help? Which previously discussed partner actions will it perform, and how does the existing personal agent connect?

Payment setup

What website URL and remaining setup are needed for payment processing?

Business rules

What exact settings should we use for shipping statuses, large-order reviews, discounts, rewards, and profit calculations?
